Keep it an original
with genuine
ZF parts!

Brake wear parts

When safety is your top priority
– always insist on genuine ZF spare parts

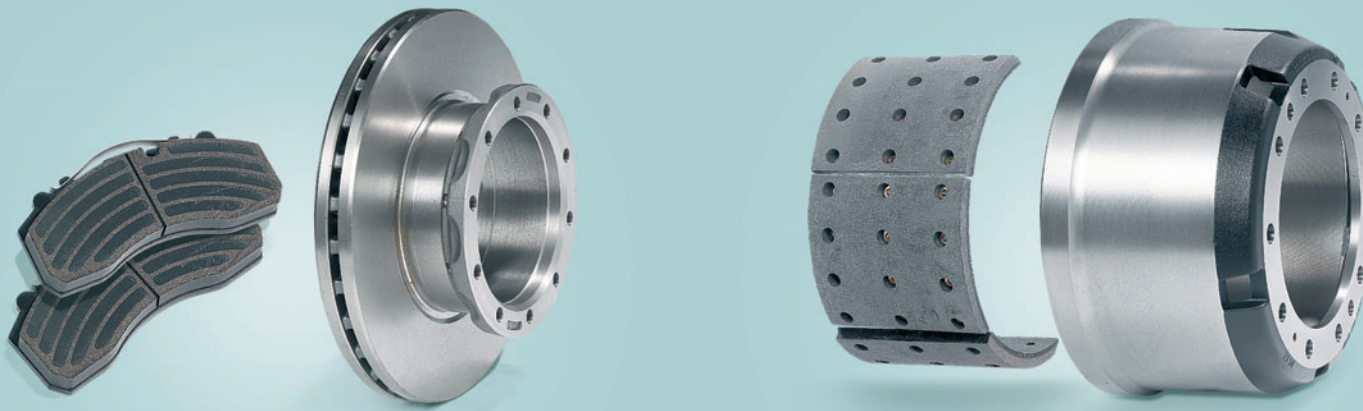

The demands for high equipment availability, low operating costs and long service intervals have led to more stringent requirements on service parts in buses and construction equipment. Safety certainly is the most important aspect when it comes to brake spare parts. Right from the start, the original equipment of ZF transmission and axle components with top-quality wear parts ensures maximum mileage and reliable operation of your machines. Servicing your equipment with genuine spare parts from ZF is your best guarantee for maintaining the original vehicle performance. Only genuine parts are perfectly matched to the particular vehicle requirements and features. They were developed along with the ZF vehicle components to ensure optimum interaction.

ZF and its production partners are heavily investing in research & development, manufacture and quality control of their spare parts to make them fully meet these high technical demands, including vehicle-specific characteristics, warranty requirements and safety standards.

Genuine ZF parts are your safest way of avoiding time-consuming and expensive downtime and achieving outstanding operating economy.

Driveline and Chassis Technology

Reliable quality parts require a great deal of know-how and high levels of investment that cannot be matched by low-cost suppliers. One who decides to use what are supposedly cheaper imitations, will make no savings in the long run.

Genuine ZF brake spare parts in different sizes for disc and drum brakes can be purchased worldwide within shortest time.

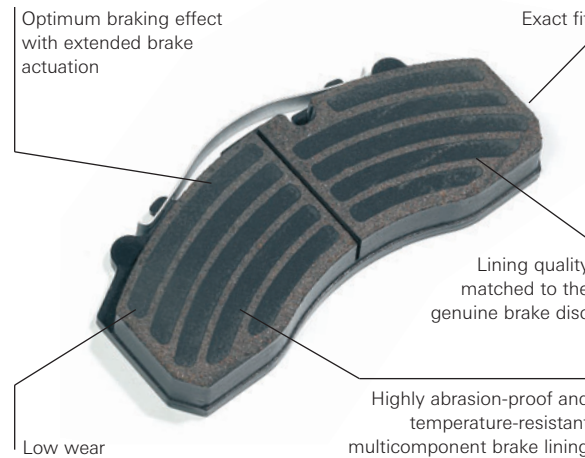

Only genuine ZF spare parts guarantee the reliability of your vehicles.

Modern brake systems meet highest levels of requirements. They must comply with high speeds and vehicle weights, or reliably work with electronic control systems such as ABS. In critical situations, frequently everything depends on one component, the brake. At this sensitive point in the vehicle, it is therefore highly essential to trust in the right spare parts.

Only genuine ZF brake spare parts offer you the following advantages:

- Maximum high-temperature stability of brakes (fading resistance)
- Exact matching to axle and vehicle system
- Optimized and proven friction pairing
- Quick lining change by assembly aids
- High-quality individual components and workmanship
- Continuous quality control in production
- Permanent upgrading and adjustments to product improvements within the vehicle
- Worldwide and quick supply of spare parts

Genuine ZF brake lining sets - Details are the quality.

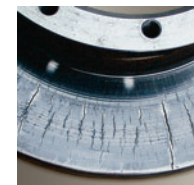

Genuine part

Savings in the quality of materials used and deficiencies in the manufacture and quality control of imitations often lead to shocking safety defects after short operating periods.

Imitation

Imitations jeopardize vehicle safety.

First impressions can be deceiving: It's often impossible to distinguish counterfeit parts from the originals. Packaging is copied; even trade names and part numbers are falsified. The big differences are in the details: examples being improper workmanship, low-grade materials or poor design, e.g. by part reduction.

Use of non-ZF products often causes loss of machine efficiency, reliability and safety, resulting in shorter service intervals, accumulated failures, costly damage, or passenger safety being put at risk.

You may also lose warranty protection by ZF – in certain cases even the general operating license for your vehicle.

Above-average, rapid material wear towards the end of the service interval is a clear sign of inferior imitation quality.

Insist on getting genuine spare parts from authorized service dealers for the maintenance of your machines.
